

VOICE ASSURED BROADBAND

Voice assured broadband is designed to deliver improved quality of service for voice calls. This makes it an ideal solution for businesses who want to take advantage of ISDN alternatives such as SIP Lines. A standard Broadband connection is not consistent enough for some, to support vital voice traffic & deliver the quality of calls you need, on an IP phone system.

With Atlas' voice assured broadband service, customers benefit from intelligent routing that prioritizes voice traffic over general Internet use, when there is high demand.
